

The background is a light blue grid. There are several blue lines and circles: a vertical line on the left, a horizontal line near the top, a horizontal line near the bottom, and a vertical line on the right. There are also two small blue circles, one near the top-left intersection and one near the bottom-right intersection.

MAVEN , GRADLE, MOCKITO

AGENDA

- ◆ MAVEN
- ◆ GRADLE
- ◆ MAVEN VS GRADLE
- ◆ MOCKITO - JAVA

Introduction to Maven

Build

- ◆ Preprocessing
- ◆ Compilation
- ◆ Postprocessing
- ◆ Distribution
- ◆ Deployment

What is Maven?

- ◆ Mostly used as a **build** tool for Java projects
- ◆ It is more than a build tool
 - Project Object Model (POM)
 - Project lifecycles
 - Dependency management
 - Plugin framework
- ◆ It is a **project management** tool

A Simple Maven Example

pom.xml

```
<project>
  <modelVersion>4.0.0</modelVersion>
  <groupId>edu.calstatela.cs520</groupId>
  <artifactId>maven-exmample</artifactId>
  <version>1.0</version>
</project>
```

Run:

```
mvn compile
mvn package
```

pom.xml and modelVersion

- ◆ `pom.xml` is a description of the project
- ◆ `modelVersion` is the version of the “grammar” of the description

Maven Coordinates

◆ groupId

- Name of the company, organization, team etc., usually using the reverse URL naming convention

◆ artifactId

- A unique name for the project under groupId

◆ version

◆ packaging, default: jar

◆ classifier

Maven coordinates uniquely identifies a project.

Convention Over Configuration

- ◆ Systems, libraries, and frameworks should assume *reasonable defaults*.

Default Directory Structure

- ◆ `src/main/java`
- ◆ `src/main/resources` for files that should be placed under classpath
- ◆ `src/main/webapp` for web applications
- ◆ `src/test/java`
- ◆ `target`

Build Lifecycle

- ◆ The process for building and distributing a project
- ◆ A build lifecycle consists of a number of steps called **phases**.

Some Default Lifecycle Phases

◆ validate

◆ compile

◆ test

◆ package

◆ deploy

http://maven.apache.org/guides/introduction/introduction-to-the-lifecycle.html#Lifecycle_Reference

Goals and Plugins

- ◆ Goals, a.k.a. Mojos, are operations provided by Maven plugins

Some Maven Plugins

- ◆ resources
- ◆ compiler
- ◆ surefire
- ◆ jar, war

<http://maven.apache.org/plugins/index.html>

Example of Using a Plugin

```
<build><plugins><plugin>
  <groupId>org.apache.maven.plugins</groupId>
  <artifactId>maven-compiler-plugin</artifactId>
  <version>2.3.2</version>
  <executions><execution>
    <id>default-compile</id>
    <phase>compile</phase>
    <goals>
      <goal>compile</goal>
    </goals>
    <configuration>
      <target>1.6</target>
    </configuration>
  </execution></executions>
</plugin></plugins></build>
```

About The Plugin Example

- ◆ A plugin is uniquely identified by its coordinates just like any other project
- ◆ Goals are usually associated (i.e. *bound*) to a build lifecycle phase
- ◆ The behavior of a goal can be customized with additional parameters in the <configuration> section

Run a Maven Build

```
mvn <phase>
```

- ◆ Maven will go through each build lifecycle phase up to the specified phase
- ◆ In each phase, execute the goals bound to that phase

Run a Maven Build in Eclipse

- ◆ Need the `m2e` Eclipse plugin
- ◆ Right click on the project then select
Run As → Maven Build ...
- ◆ Give the build a name
- ◆ Enter the phase name for `Goals`
- ◆ Click Run

Why Not Just Use an IDE

- ◆ Can your IDE do *everything* you want?
 - Deploy a web application to a remote server
 - Generate source code from some metadata files
 - Create a zip package of selected files for homework submission
 - ...

Why Use Maven

- ◆ Everybody uses it!
- ◆ Common framework for project build and management
 - Project Object Model
 - Build lifecycles
- ◆ Archetype
- ◆ Dependency management
- ◆ Resource filtering

Archetype

- ◆ An archetype is a *template* for a Maven project which can be used to create new projects quickly
- ◆ Example: creating a project from archetype
 - `maven-archetype-quickstart`
 - `maven-archetype-webapp`
- ◆ Users can create new archetypes and publish them through catalogs
 - Main Maven archetype catalog:
<http://repo1.maven.org/maven2/archetype-catalog.xml>

Dependency Management

- ◆ A **dependency** of a project is a library that the project depends on
- ◆ Adding a dependency to a project is as simple as adding the coordinates of the library to `pom.xml`
- ◆ Maven *automatically downloads the library from an online repository* and store it locally for future use

Dependency Example

```
<dependencies>
  <dependency>
    <groupId>javax.servlet</groupId>
    <artifactId>javax.servlet-api</artifactId>
    <version>3.0.1</version>
  </dependency>
</dependencies>
```

- ◆ Add a dependency to `pom.xml`
- ◆ Add a dependency in Eclipse

Dependencies and Repositories

- ◆ Search for dependency coordinates at <http://mvnrepository.com/>
- ◆ Maven Central Repository - <http://repo1.maven.org/maven2/>
- ◆ Additional libraries and repositories - <https://maven.nuxeo.org/>

More About Dependency Management

- ◆ Dependencies of a dependency are automatically included
- ◆ Dependency conflicts are automatically resolved
- ◆ See CSNS2 for example

Resource Filtering

- ◆ Use placeholders in resource files and replace them with actual value during the build process

```
<param name="File" value="${app.dir.log}/csns2.log" />
```

```
<param name="File" value="F:/TEMP/csns2/csns2.log" />
```

Resource Filtering Example

```
<build>
  <filters>
    <filter>build.properties</filter>
  </filters>
  <resources>
    <resource>
      <directory>src/main/resources</directory>
      <filtering>true</filtering>
    </resource>
  </resources>
</build>
```

Summary

- ◆ Project Object Model (POM)
- ◆ Coordinates
- ◆ Lifecycles and phases
- ◆ Plugins and goals
- ◆ Archetype
- ◆ Dependency management
- ◆ Resource filtering

Sonatype

ABOUT GRADLE

- A open source Java-based build automation tool
 - Requires a recent version of JDK or JRE installed
 - Main focus is on Java projects
- Uses groovy which is actually very similar to Java (not surprising)
- Automates the compiling and packaging of projects
- Manage project dependencies
- Allow for the easier setup of project workspace for incoming developers

ABOUT GRADLE

- Gradle is very modular
 - The base program itself is rather basic
- Easy to use and requires no installation if you use the wrapper
 - This eliminates the problem out having different gradle versions among a team of developers
 - The wrapper can easily be bundled with the program source code, so it won't become another dependency a new developer have to manage when setting up a new project environment
- Everything else is done by plugins and user generated scripts

ABOUT GRADLE

- At its core, Gradle is just the execution of a series of tasks.
- By default, plugins will define a set of tasks
 - Users can also define their own tasks
- All tasks will be executed only once
- Tasks can depend on another task – therefore users can easily set the order of the tasks executed
 - The tasks can be seen as nodes in a Directed Acyclic Graph.

GRADLE JAVA TASKS

```
1  apply plugin: 'java'
2
3  repositories {
4      mavenCentral()
5  }
6
7  sourceSets {
8      main {
9          java {
10             srcDirs = ['src']
11         }
12     }
13     test {
14         java {
15             srcDirs = ['test/java']
16         }
17     }
18 }
19
20 dependencies {
21     testCompile 'junit:junit:4.12'
22 }
23
24 test {
25     /*
26      * Prints the currently running test's name to the CI's build log,
27      * so that we can check if tests are being silently skipped or stalling the build.
28      */
29     if (System.env 'CI') {
30         beforeTest { descriptor ->
31             logger.lifecycle("Running test: " + descriptor)
32         }
33     }
34 }
35
36 compileJava {
37     sourceCompatibility = 1.8
38     targetCompatibility = 1.8
39 }
40
41 defaultTasks 'clean', 'test'
42
```

APPLY THE PLUGIN

The Java plugin adds some of the essential default tasks to Gradle such as `compileJava` and `build`.

```

1  apply plugin: 'java'
2
3  repositories {
4      mavenCentral()
5  }
6
7  sourceSets {
8      main {
9          java {
10             srcDirs = ['src']
11         }
12     }
13     test {
14         java {
15             srcDirs = ['test/java']
16         }
17     }
18 }
19
20 dependencies {
21     testCompile 'junit:junit:4.12'
22 }
23
24 test {
25     //
26     // Prints the currently running test's name in the CI's build log.
27     // so that we can check if tests are being silently skipped or failing the build.
28     //
29     if (System.env 'CI') {
30         beforeTest { descriptor ->
31             logger.lifecycle('Running test: ' + descriptor)
32         }
33     }
34 }
35
36 compileJava {
37     sourceCompatibility = 1.8
38     targetCompatibility = 1.8
39 }
40
41 defaultTasks 'clean', 'test'
42

```

REMOTE REPOSITORIES

This line tells Gradle where to look
(if necessary) for dependencies
artifact (a fancy word for a jar file).

You can define custom remote
repositories here (such as your ftp
server)

```

1  apply plugin: 'java'
2
3  repositories {
4      mavenCentral()
5  }
6
7  sourceSets {
8      main {
9          java {
10             srcDirs = ['src']
11         }
12     }
13     test {
14         java {
15             srcDirs = ['test/java']
16         }
17     }
18 }
19
20 dependencies {
21     testCompile 'junit:junit:4.12'
22 }
23
24 test {
25     /*
26      * Prints the currently running test's name to the CI's build log,
27      * so that we can check if tests are being silently skipped or stalling the build.
28      */
29     if (System.env.'CI') {
30         beforeTest { descriptor ->
31             logger.lifecycle("Running test: " + descriptor)
32         }
33     }
34 }
35
36 compileJava {
37     sourceCompatibility = 1.8
38     targetCompatibility = 1.8
39 }
40
41 defaultTasks 'clean', 'test'
42

```

DEFINE SOURCES

This section is entirely optional.

If not defined, the Java plugin will use the following defaults:

src/main/java
Production Java source

src/main/resources
Production resources

src/test/java
Test Java source

src/test/resources
Test resources

```

1  apply plugin: 'java'
2
3  repositories {
4      mavenCentral()
5  }
6
7  sourceSets {
8      main {
9          java {
10             srcDirs = ['src']
11         }
12     }
13     test {
14         java {
15             srcDirs = ['test/java']
16         }
17     }
18 }
19
20 dependencies {
21     testCompile 'junit:junit:4.12'
22 }
23
24 test {
25     //
26     // Prints the currently running test's name in the CI's build log,
27     // so that we can check if tests are being silently skipped or failing the build.
28     //
29     if (System.env.'CI') {
30         beforeTest { descriptor ->
31             logger.lifecycle('Running test: ' + descriptor)
32         }
33     }
34 }
35
36 compileJava {
37     sourceCompatibility = 1.8
38     targetCompatibility = 1.8
39 }
40
41 defaultTasks 'clean', 'test'
42

```

DEPENDENCIES

Here is where you can define all your project dependencies.

There are several possible types of dependencies that you can define here. Some important ones:

compile:

Compile time dependencies

testCompile:

Additional dependencies for compiling tests

Additionally, plugins may define additional types of dependencies (like `deobfCompile`)

```

1  apply plugin: 'java'
2
3  repositories {
4      mavenCentral()
5  }
6
7  sourceSets {
8      main {
9          java {
10             srcDirs = ['src']
11         }
12     }
13     test {
14         java {
15             srcDirs = ['test/java']
16         }
17     }
18 }
19
20 dependencies {
21     testCompile 'junit:junit:4.12'
22 }
23
24 test {
25     /*
26      * Prints the currently running test's name in the CI's build log,
27      * so that we can check if tests are being silently skipped or stalling the build.
28      */
29     if (System.env.'CI') {
30         beforeTest { descriptor ->
31             logger.lifecycle("Running test: " + descriptor)
32         }
33     }
34 }
35
36 compileJava {
37     sourceCompatibility = 1.8
38     targetCompatibility = 1.8
39 }
40
41 defaultTasks 'clean', 'test'
42

```

DEFAULT TASKS

Here is where you can define default tasks to run when no task is defined (when the user runs `./gradlew`)

Note because tasks depend on each other, making the default task build will result in all the tasks being run (such as `compileJava` etc.)
